**Policy code**  
DTP_FRU_0519

**Date**  
May, 2019

**Purpose**  
To ensure a consistent procedural approach to furosemide (frusemide) administration.

**Scope**  
Applies to all Queensland Ambulance Service (QAS) clinical staff.

**Health care setting**  
Pre-hospital assessment and treatment.

**Population**  
Applies to all ages unless specifically mentioned.

**Source of funding**  
Internal – 100%

**Author**  
Clinical Quality & Patient Safety Unit, QAS

**Review date**  
May, 2022

**Information security**

**Furosemide (frusemide)**

**Drug class**
Loop diuretic

**Pharmacology**
Furosemide (frusemide) is a potent loop diuretic that acts by inhibiting sodium and chloride absorption in the ascending Loop of Henle (proximal and distal tubules).[1–3]

**Metabolism**
The majority of parenteral frusemide is excreted in the urine within 24 hours, the remainder is excreted in the faeces.[4]

**Indications**
- Congestive cardiac failure
- Fluid overload (with compromised renal function)
- Oliguria (after correction of hypotension and hypovolaemia)

**Contraindications**
- Allergy and/or Adverse Drug Reaction
- Pre-hospital use in acute cardiogenic pulmonary oedema
- Patients < 12 years of age

**Precautions**
- Hypotension

**Side effects**
- Marked diuresis can lead to hypotension
- Potassium loss associated with diuresis may aggravate or potentiate dysrhythmias

**Presentation**
- Ampoule, 20 mg/2 mL furosemide (frusemide)

**Onset (IV)**
3–5 minutes (peak 30 minutes)

**Duration (IV)**
≈ 2 hours (following stat IV dose)

**Half-life**
1.5 hours
**Furosemide (frusemide)**

### Schedule
- S4 (Restricted drugs).

### Routes of administration
- Intravenous infusion (IV INF)

### Special notes
- Ambulance officers must only administer medications for the listed indications and dosing range. Any consideration for treatment outside the listed scope of practice requires mandatory approval via the QAS Clinical Consult and Advice Line.
- Increased infusion doses may be required in patients with chronic renal impairment and/or who take regular high dose oral furosemide (frusemide).
- All cannulae and IV lines must be flushed thoroughly with sodium chloride 0.9% following each medication administration.

### Adult dosages
- **Congestive cardiac failure**
- **Fluid overload** (with compromised renal function)
- **Oliguria** (after correction of hypotension and hypovolaemia)

### Paediatric dosages
- **Note:** QAS officers are **NOT** authorised to administer furosemide (frusemide) to paediatric patients.

---

**CCP EsoP aeromedical – RSQ Clinical Coordinator consultation and approval required in all situations.**

Continue furosemide (frusemide) infusions already commenced at hospital, using the same concentration and administration rate already established. This may involve withdrawing previously mixed and labelled solutions from the referring hospital. Should the RSQ Clinical Coordinator request a furosemide (frusemide) infusion be commenced, the following procedure is to be undertaken.

Commence infusion at **5 mg/hour** (2.5 mL/hour) and increase by **5 mg/hour** (2.5 mL/hour) every **60 minutes** to a maximum dose of **20 mg/hour** (10 mL/hour) until the desired urine output is achieved.

**Syringe preparation:** Mix 100 mg (10 mL) of furosemide (frusemide) with 40 mL of sodium chloride 0.9% in a 50 mL syringe to achieve a final concentration of 2 mg/mL. Ensure all syringes are appropriately labelled. Administer via syringe driver.
